

Patient Information	Specimen Information	Client Information

Test Name	In Range	Out Of Range	Reference Range	Lab
DENGUE FEVER AB (IGM)	1.32			EZ

REFERENCE RANGE: < = 1.65

INTERPRETIVE CRITERIA:

< = 1.65	Antibody not detected
1.66 - 2.83	Equivocal
> = 2.84	Antibody detected

This assay detects IgM against all 4 Dengue virus serotypes, and the antibody response is not serotype-specific. A new IgM response may occur when exposure to a second dengue serotype occurs. In most patients, Dengue IgM is detectable after the sixth day following the onset of symptoms, and is highly suggestive of acute disease. Before day 6 of symptoms, both IgM and IgG may be negative and alternate testing (Dengue NS-1 Antigen or Dengue PCR) is recommended. A positive IgM may persist for several months after infection. Cross-reactivity with other flaviviruses (eg. Zika virus) is known to occur; the extent and degree of serologic cross-reactivity varies. A positive Dengue virus IgM is presumptive evidence of infection. Patients at risk for Zika virus infection should also be evaluated for Zika virus per CDC guidelines.
