Current guidelines and recommendations do not recommend routine screening for HSV-2 in asymptomatic individuals, including those that are pregnant. The detection of HSV-2 IgG antibodies in a single sample indicates previous exposure to HSV-2 but does not give information as to the site of HSV infection or the timing of exposure. The predictive value of positive and negative results depends on the population's prevalence and the pretest likelihood of HSV-2. HSV-2 IgG testing performed using the Roche Elecsys HSV-2 IgG assay.
