**CANDIDA ALBICANS AB (IGG)** **1.2 H**  
 REFERENCE RANGE: <1.0

INTERPRETIVE CRITERIA:  
 <1.0 Antibody not detected  
 > or =1.0 Antibody detected

Systemic candidiasis is often characterized by markedly elevated levels of IgG recognizing Candida. However, interpretation of Candida IgG levels is complicated by detection of antibodies in 20-30% of healthy individuals, and blunted responses in immunocompromised patients at risk for systemic candidiasis. Candida IgG results should be considered within the context of clinical findings and results from other relevant laboratory tests, such as Candida antigen detection and/or culture.

This test was performed using a kit that has not been cleared or approved by the FDA. The analytical performance characteristics of this test have been determined by Quest Diagnostics Infectious Disease. This test should not be used for diagnosis without confirmation by other medically established means.
